Image with no alt text. Characteristics of an Effective LeaderQ: Convert a huge numpy matrix into number Hey guys I am trying to convert an array of 1.000.000 lines into number and than back to numpy array. I tried this code: import numpy as np import pandas as pd from scipy import * def toNum(self, element): X=np.zeros(size=(1.000.000, 10)) #X is the original array containing 1.000.000 lines for row in X: for i in row: X[row, i]=float(i) return X i = np.array(["a","b","c"]) X=pd.DataFrame(i, columns=["i"]) X.toNum() but python is timing out (last line). Is there another way to solve the problem (maybe using numpy.matrix)? EDIT: Tried this: X=pd.DataFrame(i, columns=["i"]) #print(X) #print(np.array(X.values)) X.to_numpy() and it works, but I don't know why I am getting this error with `X.values` : ValueError Traceback (most recent call last) in () 3 X.to_numpy() 4 ----> 5 print(np.array(X.values)) /usr/local/lib/python3.5/dist-packages/numpy/__init__.py in toarray(arr, order) 584 585 # This is required to make this function reentrant. --> 586 return ndarray.__array_wrap__(arr, order=order, typ=arr.d f678ea9f9e
